ADVENTURE TRAILS – TREKKING & CAMPING WEBSITE

HTML, CSS and Output Documentation

1. Website Description

Adventure Trails is a trekking and camping website created to present outdoor adventure experiences in an attractive and organized way. It introduces visitors to trekking routes, camping experiences and upcoming trip schedules. The website is intended to help users explore different outdoor activities and compare basic information such as difficulty level, trip duration, distance and price.

The webpage contains a header with the Adventure Trails logo and navigation links, a welcome banner, popular trekking-route cards, camping-experience cards and an upcoming-trip schedule. Each activity card shows a title, short description and relevant trip details. The design uses nature-related images and green colours to create an outdoor-adventure theme.

2. HTML Code

HTML (HyperText Markup Language) is used to build the structure and organize the content of the Adventure Trails webpage. The screenshot below shows the HTML source code opened in Visual Studio Code.

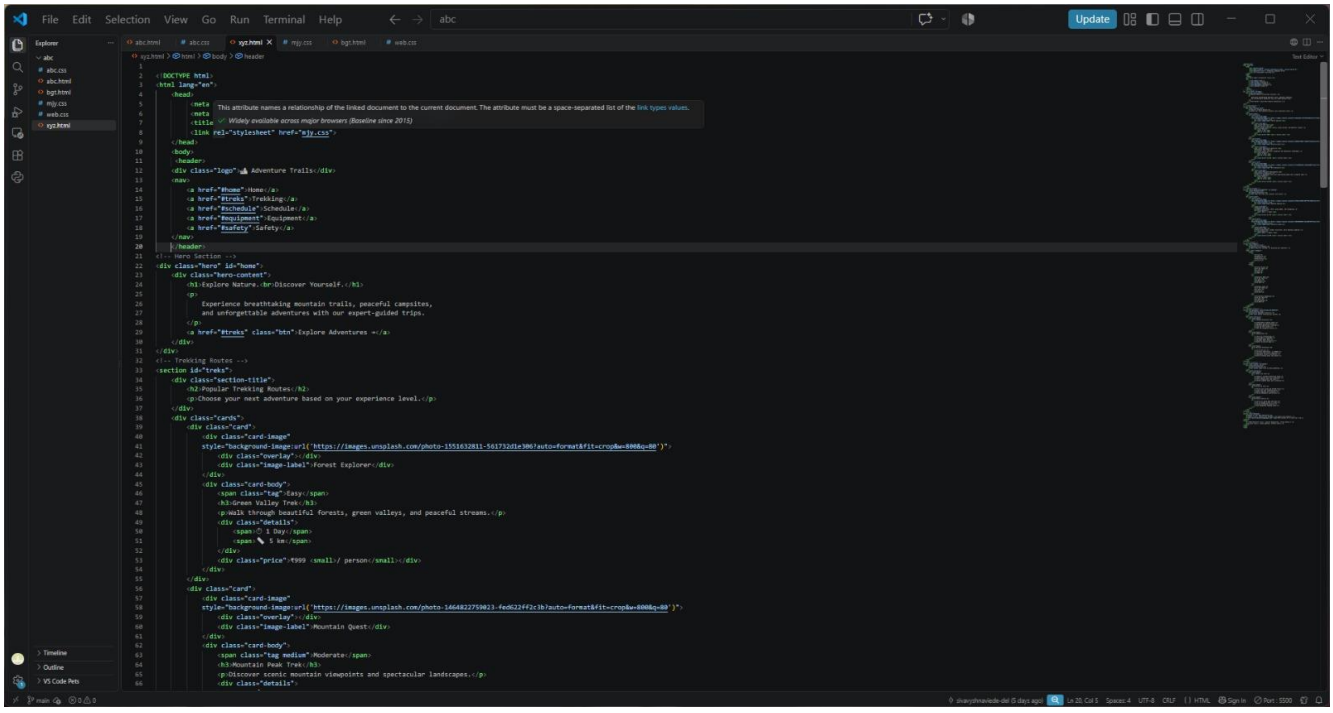

Figure 1: HTML source code of the Adventure Trails website.

HTML elements and features used

- **Basic document structure:** <!DOCTYPE html>, <html>, <head> and <body> establish the webpage structure.
- **Page settings:** <meta> elements provide character-encoding and viewport information, and <title> defines the browser-tab title.
- **External CSS connection:** The <link> element connects the HTML file to the separate CSS stylesheet named myj.css.

- **Header and navigation:** <header> and <nav> organize the website name and navigation links such as Home, Trekking, Schedule, Equipment and Safety.
- **Navigation links:** Anchor (<a>) elements connect visitors to different sections of the webpage.
- **Hero section:** elements with classes such as hero and hero-content group the welcome heading, introductory text and Explore Adventures link.
- **Trekking route cards:** <section>, , <h3>, <p> and elements organize route names, descriptions, difficulty labels, duration, distance and prices.
- **Image presentation:** CSS background-image styling is applied to card-image containers to display outdoor photographs.
- **Structured content:** Sections and content containers separate trekking routes, camping experiences and the trip schedule.

3. CSS Code

CSS (Cascading Style Sheets) is used to control the appearance, colours, spacing and layout of the Adventure Trails webpage. The screenshot below shows the CSS stylesheet used to style the website.

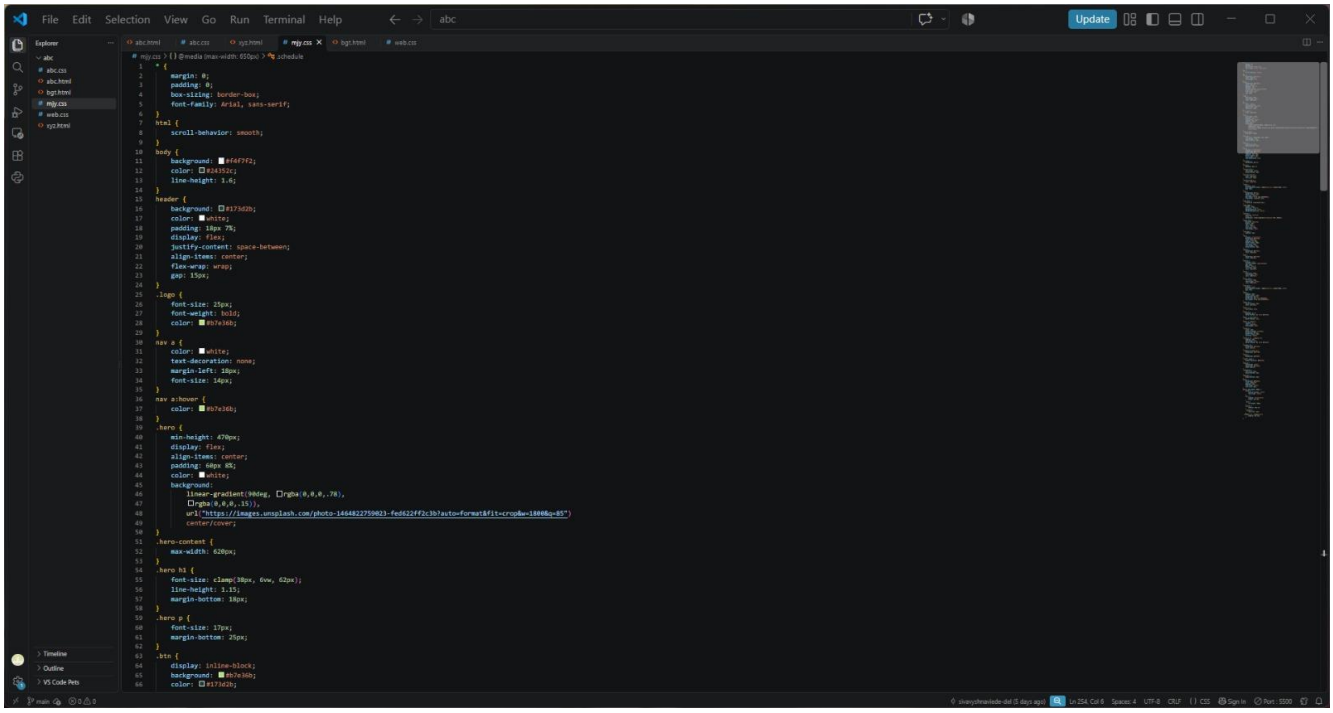

Figure 2: CSS stylesheet used for the Adventure Trails website.

CSS properties and styling techniques used

- **Universal selector (*):** Resets default margins and padding, applies border-box sizing and sets a common font family.
- **HTML and body styling:** Enables smooth scrolling and sets the page background colour, text colour and line height.
- **Header styling:** Uses a dark-green background, white text, Flexbox layout, padding and spacing to arrange the logo and navigation.
- **Logo and navigation:** Uses font size, font weight, colour and link styling to make the website name and menu easy to identify.
- **Hover effect:** Changes the navigation-link colour when a visitor moves the pointer over a link.
- **Hero section:** Uses a large minimum height, Flexbox alignment, padding, white text and a nature background image.
- **Gradient overlay:** Combines a dark transparent gradient with the background image to improve the visibility of the hero text.
- **Typography:** Uses font sizes, line height and margins to create a clear hierarchy between headings and descriptions.
- **Responsive styling:** Includes a media query for smaller screen widths so the layout can adapt to different devices.
- **Spacing and layout:** Uses padding, margins, gaps and layout properties to keep the website sections and cards organized.

4. Output

The following screenshot shows the completed Adventure Trails webpage running in a web browser through a local development server. It demonstrates the final appearance produced by combining the HTML structure with the CSS styling.

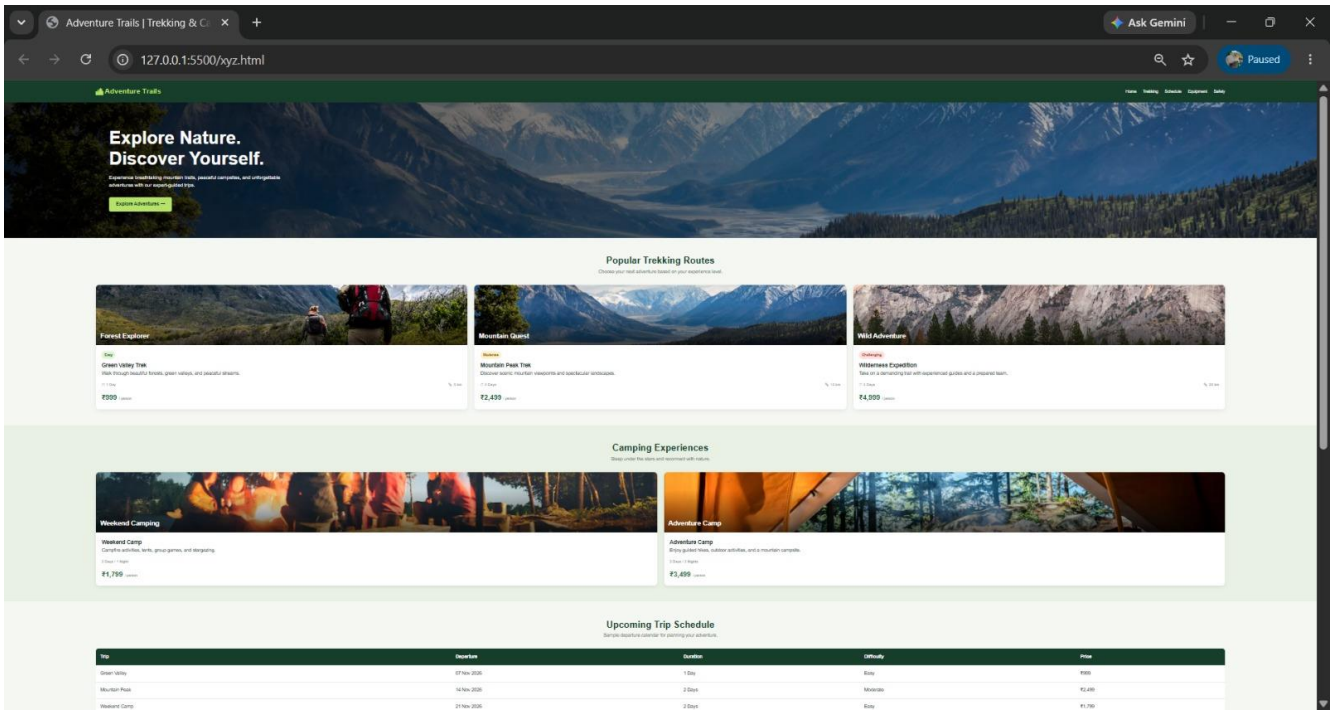

Figure 3: Browser output of the Adventure Trails trekking and camping website.

Description of the output

- The top header displays the Adventure Trails name with a nature-themed logo and navigation links for the main sections.
- The hero banner contains the heading “Explore Nature. Discover Yourself.”, a short introduction and an Explore Adventures button over a mountain background image.
- The Popular Trekking Routes section displays three route cards: Green Valley Trek, Mountain Peak Trek and Wilderness Expedition. Each card includes an image, difficulty level, description, duration, distance and price.
- The Camping Experiences section presents Weekend Camp and Adventure Camp options with photographs, descriptions and prices.
- The Upcoming Trip Schedule section displays trip information in a table, including trip name, departure date, duration, difficulty and price.
- The green colour theme and outdoor photographs support the trekking and camping topic, while the cards and table make the information easy to scan.

Overall, the output is a visually organized outdoor-adventure website. It presents trekking routes, camping options and trip schedules in separate sections, allowing visitors to understand and compare the sample activities. The displayed dates, descriptions and prices are example details shown for the project.

5. Conclusion

This project demonstrates how HTML and CSS can be used together to create an informative and attractive trekking and camping website. HTML provides the structure, navigation and activity information, while CSS adds the colours, background images, spacing, typography and responsive layout. The final webpage brings these elements together to present outdoor adventure options in a clear and user-friendly format.
