WEBPAGE 01

Campus Fest 2026

Website Development Documentation

Student Name: _____ **Section:** _____

1. Website Description

Campus Fest 2026 is a college-festival information website designed to help students discover activities and plan their participation. The page introduces the festival with a welcome banner and provides navigation links to the Home, Events, Schedule, Coordinators, and Register sections.

The website presents different event categories, including Technical Events, Cultural Events, Workshops, and Fun & Games. It also displays a festival timetable with event times, names, venues, and categories. A coordinators section introduces the people students can contact for event-related information. Registration links encourage visitors to sign up.

2. HTML Code

HTML (HyperText Markup Language) is used to create the structure and content of the webpage. The screenshot below shows the HTML file being edited in Visual Studio Code.

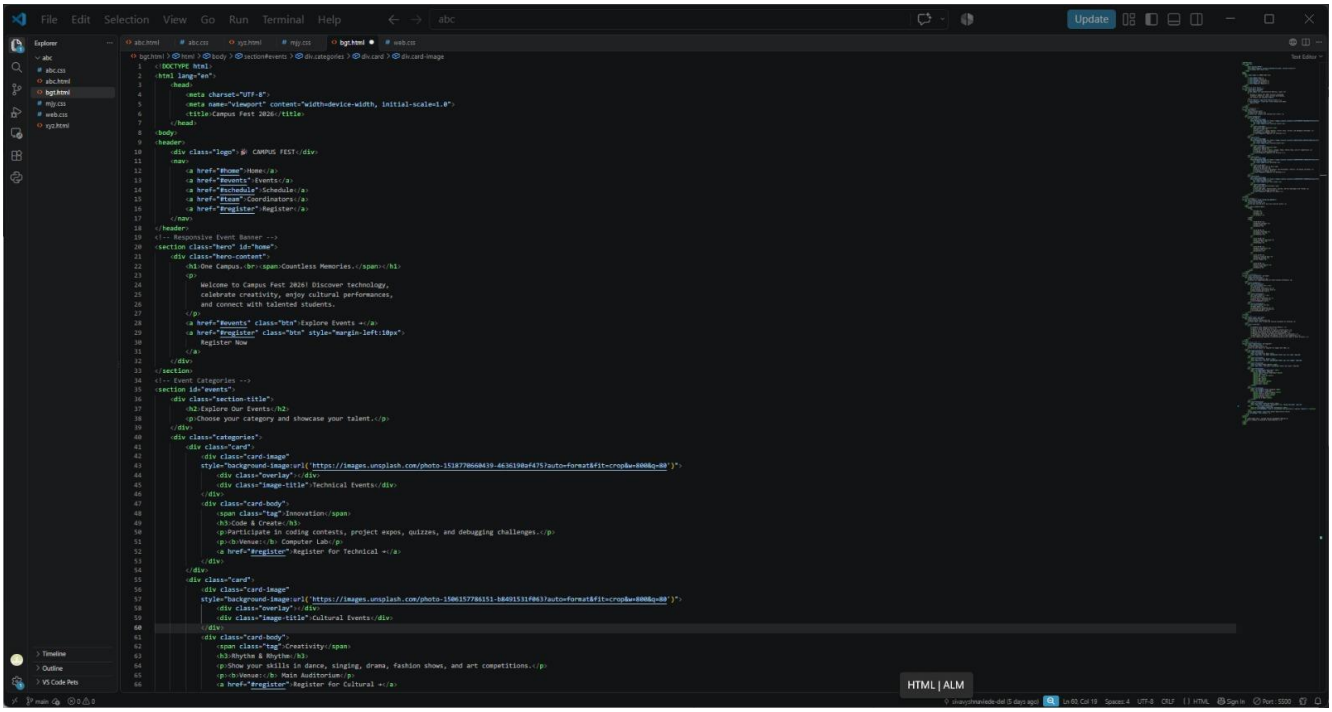

Figure 1. HTML structure for the Campus Fest 2026 webpage.

What I Used in HTML

- **Basic document structure:** <!DOCTYPE html>, <html>, <head>, and <body> establish the webpage document.
- **Page information:** <meta> tags set the character encoding and responsive viewport; <title> sets the browser-tab title.
- **Header and navigation:** <header>, <nav>, and anchor (<a>) elements create the festival branding and navigation links.
- **Hero section:** <section> and elements organize the welcome message, heading, description, and action links.
- **Event cards:** Repeated containers hold event images, category labels, descriptions, venue details, and registration links.
- **Readable content structure:** Headings, paragraphs, spans, and links organize information into clear sections.

3. CSS Code

CSS (Cascading Style Sheets) controls the visual appearance and layout of the webpage. The screenshot below shows the stylesheet in Visual Studio Code, including form styling, colors, spacing, and a responsive layout rule.

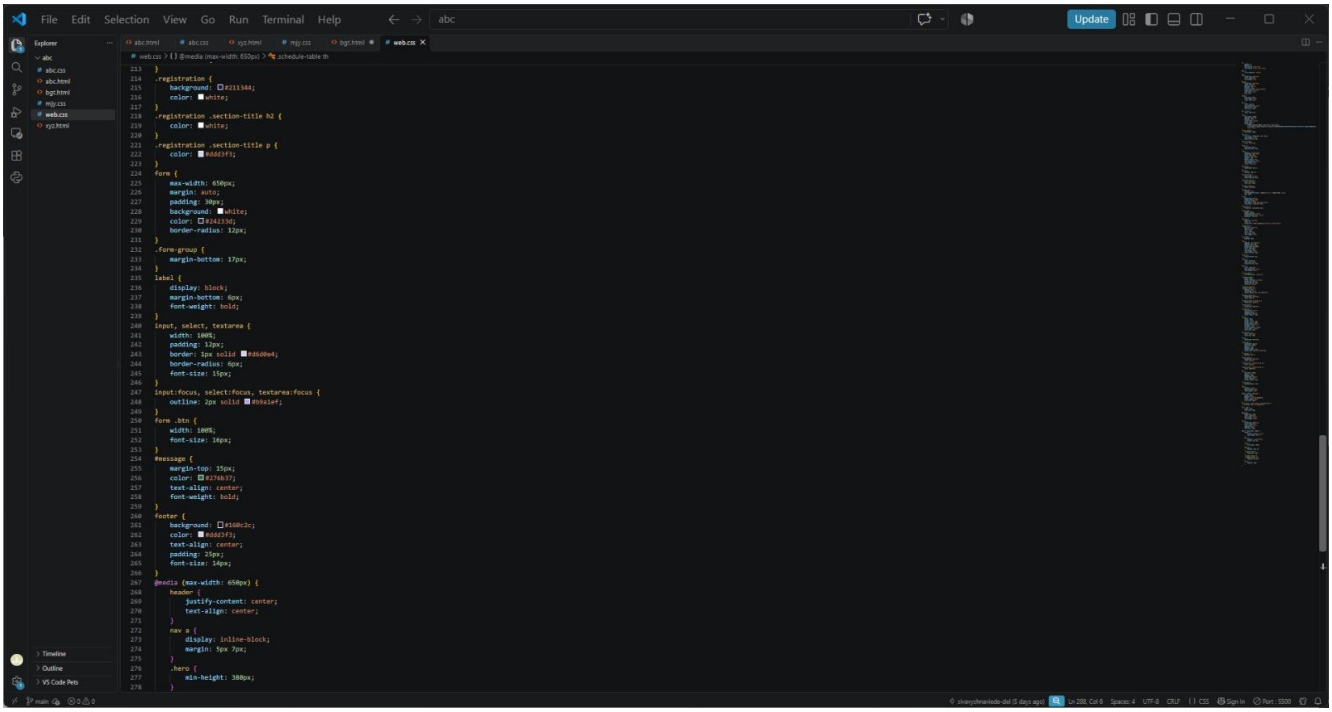

Figure 2. CSS rules used to style the webpage.

What I Used in CSS

- **Colors and backgrounds:** Background and text color properties create contrast between sections, forms, and the footer.
- **Spacing and sizing:** margin, padding, max-width, and width help position content and control its size.
- **Typography:** font-size, font-weight, and text-align make headings, labels, and descriptions easier to read.
- **Cards and form design:** background, border, border-radius, and related rules give form controls and content areas a clean appearance.
- **Input focus styling:** The :focus pseudo-class adds a visible outline when a user selects an input, select box, or text area.
- **Responsive design:** The @media (max-width: 650px) rule adjusts the header, navigation, and hero section for smaller screens.

4. Website Output

The final browser screenshot shows the Campus Fest 2026 webpage after the HTML structure and CSS styling are combined. The top banner introduces the festival and includes navigation and action buttons. Below it, event cards present the available activities with images and short descriptions. The schedule table makes event timings and venues easy to compare, while the coordinators section provides contact information.

Conclusion

This project demonstrates how HTML and CSS work together to build a complete webpage. HTML organizes the festival information into meaningful sections, while CSS improves the layout, colors, typography, forms, and responsiveness. The final result is an informative and visually organized webpage that helps students explore Campus Fest 2026.
